The identification and description of microorganisms is usually a lengthy, laborious, and costly process. In the case of bacteria, which are the most common type of microorganism, the steps of isolation and identification usually involve growing a sample of the material in a culture media or other growth-promoting environment. The sample may be cultured by using various techniques such as manual and automated plating, dilution, drop-on-agar plates, and broth-type media, such as solid and liquid media. Following the incubation period, the media are examined for evidence of microbial growth. The cells or colonies typically are identified by their morphology, which is determined by visual inspection of the colony. Additionally, for bacteria, other tests may be performed, such as microscopy and staining techniques. Various prior art methods and systems for identifying microorganisms are described in U.S. Pat
